

Visor with mounted Hatch

The Visor with Divator Hatch consists of the ambient hatch mounted on the visor, the visor is hard coated and antifog treated.

Divator Hatch is positioned on the side of the mask – not to interfere with the field of vision – and gives the diver ambient air while on stand-by or at surface level. It is easy to operate: "pull-to-open" and "push-to-close".

The Hatch has a small form factor and will not disturb the diver above or under water. The design of the valve keeps the breathing resistance extremely low. Ambient breathing will not only increase cylinder duration time but will enable the diver to keep the face mask donned while on stand-by.

Divator Hatch is a perfect complement to the Divator full face mask for any professional diver.
